

The Final Report of Project entitled

“Online Grocery Store”

Submitted in Partial Fulfillment for the Degree of

BACHELOR OF COMPUTER APPLICATION

(Session: 2023-2024)

SUBMITTED BY:

Dharmpreet Singh

BCA (6th sem)

10722153805

SUPERVISED BY :

Ms. Jaswinder kaur

(Asst. Prof. In

Com. Sci. & IT Dept.)

P.G DEPARTMENT OF COMPUTER SCIENCE & I.T

(Amardeep Singh Shergill Memorial College, Mukandpur)

Declaration

It is declared that no part of this project report entitled “Online Grocery Store” has been submitted to any other institute or university for the award of any degree. The material taken from various sources is properly referenced and acknowledged.

Name: Dharmpreet Singh

Roll No: 10722153805

Project Report on Online Grocery Store

Certificate

This is to certify that the project entitled “ **Online Grocery Store** ” is the bonfire work carried out by **Dharmpreet Singh** bearing **Roll no 10722153805** student of **BCA 6th SEM, A.S.S.M College Mukandpur Constituent College of Guru Nanak Dev University, Amritsar**, in the partial fulfillment of the requirements for the award of the Degree of Bachelor of Computer Applications and that the project has not formed the basis for the award previously of any degree, diploma, associate-ship, fellowship or any other similar title.

Er. Sukhminder Dass Bawa

(Head of Department)

Acknowledgement

The completion of the project "**Online Grocery Store**" would not have been possible without the kind co-operation of this institute. This space is less to express my gratitude and to think about those who were the source of inspiration and helped us in designing and developing this system development project for completion of our degree.

We are highly indebted and obliged to our project guide **P.G Department of Computer Science & I.T. at A.S.S.M COLLEGE, MUKANDPUR** for sparing every moment out of his busy schedule for us and providing opportunity to discuss the topics with him, for sincere and timely efforts, invaluable suggestions and guidance at all stages of development of this project.

Special Thanks are to those Friends who helped in the completion of Project. It is our privilege to express thanks to **Er. Sukhminder Bawa, H.O.D, P.G department of Computer Science & I.T. at A.S.S.M COLLEGE, MUKANDPUR** for providing us all the necessary infrastructure and facilities. Also, we are very thankful to our parents who owed the burden of my financial expense during this project. We are overwhelmingly indebted to them for their moral support, love and affection during this project that always encouraged us to work harder to meet our goals.

Name: Dharmpreet Singh

Roll No: 10722153805

Project Report on Online Grocery Store

INDEX

S.NO	CHAPTER NAME	PAGE NO.	SIGN.
1.	Report Organization	1	
2.	The Problem	2-3	
3.	Introduction To the Project	4-5	
4.	Software' & Languages used in Project	6-13	
5.	Visual Studio 2019 & MS SQL Server 2012	14-17	
6.	Design	18-21	
7.	Constraints/Conditions	22	
8.	Screenshots	23-33	
9.	Menu	34-35	
10.	Coding, Testing, Implementations & Maintenance	36-37	
11.	Bibliography	38	

1.Report organization

The report has been organized into chapters and sections. List of tables and figures involved in the whole system are equally declared. All the details of the project have been studied and inculcated in the project report hoping that the reader may not find any inconsistencies.

Chapter-1: It describes the project problem in detail. The introduction section gives the overview of the whole problem. It describes the Problem definition, Existing system, Proposed System in detail.

Chapter-2: It describes the Software and languages used in this project in detail. The coding part of this Website can be written in the languages such as ASP.NET, C#, JQuery etc.

Chapter-3: It describes the Visual Studio 2019 & MS SQL Server 2012 in detail.

Chapter-4: It deals with the design issues of the software. It includes the design, process design which tells the role of each form and then the module design of each module is explained in detail. It also shows some Screenshots related Database, Table etc.

Chapter-5: This phase is dedicated to the Conditions/Constraints of the project. The next section deals with the actual user interface that includes the menus, screenshots of the different WebPages.

Chapter-6: It includes the screenshots of each and every section of Website.

Chapter-7: It includes the Menu and Brief detail about User menus &Admin menu.

Chapter-8: It Deals with the implementation of the system. It includes the introduction to the implementation phase. It also includes different phases of project such as Coding, Testing and Maintenance etc.

Chapter-9: In this chapter, it deals how to work systematically, how to think on a wider scope, how to put theoretical concepts practically. It helps to check validation without any difficulty.

2.Revising the Problem

Problem Definition

In the modern busy life, every person has its basic needs and among these need grocery products are one of them. Every person once in a month or a week could go to market to buy those daily need products

Offline grocery stores face several challenges that can affect both customers and store operations. One major issue is limited convenience; customers must physically visit the store, which can be time-consuming and inconvenient, especially for those with busy schedules or mobility issues. Inventory management can be problematic, as stock levels need to be accurately maintained to avoid overstocking or stockouts. This can lead to wasted produce or unsatisfied customers. Additionally, offline stores have higher operational costs, including rent, utilities, and staffing, which can impact pricing and profitability. The lack of personalized shopping experiences and the difficulty in quickly updating promotions or responding to market changes also pose significant challenges. These issues collectively make it harder for offline grocery stores to compete with the convenience and efficiency of online alternatives.

Proposed System

Online grocery stores solve many problems of offline stores. They let you shop from home and get groceries delivered, saving you time and effort. They keep better track of stock, so items are less likely to run out. With fewer physical locations and staff, they can reduce costs. Online stores also use smart tools to suggest products you might like. During emergencies, they can operate more safely and keep supplies steady, making them more reliable than traditional stores.

Hardware & Software Requirements

Hardware Specification:

PROCESSOR : 11th Gen Intel(R) Core(TM) i3-1115G4 @ 3.00GHz 2.90 GHz

RAM : 8.00 GB

HARD DISK : 512 GB

Software Specification:

Operating System : Windows 11 Home Single Language

Languages : MVC C# .Net and ASP .Net

Tool : Visual studio 2019

Backend : SQL Server 2012

3.Introduction to the Project

The online grocery store website project aims to develop a digital platform where users can purchase groceries and household items over the internet. This project focuses on creating a convenient, user-friendly website that allows customers to browse through a wide variety of products, select items for purchase, and complete transactions securely from their computers or mobile devices.

The website will feature an intuitive interface, detailed product descriptions, and a shopping cart system to facilitate easy navigation and seamless purchasing. Advanced search and filtering options will help users quickly find specific products, while secure payment gateways will ensure the safety of financial transactions. An order tracking feature will allow customers to monitor the status of their deliveries in real-time.

The project also includes implementing user accounts for personalized experiences, offering discounts and promotions, and integrating customer reviews and ratings to assist in decision-making. The platform will be designed to be responsive, ensuring accessibility across different devices, including smartphones and tablets.

Overall, the online grocery store website project aims to enhance the shopping experience by providing a reliable, efficient, and secure online solution for purchasing groceries and household necessities.

Scope & Objectives of Project

The objective of the online grocery store website project is to create a comprehensive, user-friendly platform that enhances the grocery shopping experience by leveraging digital technologies. This project aims to meet the following key goals:

1. **Convenience and Accessibility:** To offer a convenient shopping solution where customers can easily browse and purchase groceries from the comfort of their homes. The website will be accessible across various devices.
2. **Wide Range of Products:** To provide an extensive selection of wide range ensures that users can find all their necessary items in one place, saving time and effort.
3. **User-Friendly Design:** The website will feature easy navigation, detailed product descriptions, and high-quality images, making it straightforward for users to find and purchase items.
4. **Secure Transactions:** To implement robust security measures that protect users' personal and payment information. This includes using SSL encryption for secure communication and adhering to industry standards for handling financial transactions.
5. **Customer Engagement and Support:** To integrate features such as personalized recommendations to enhance user engagement. The project will offer comprehensive customer support to assist with any issues or inquiries, ensuring a positive shopping experience.
6. **Promotions and Discounts:** To offer various discounts, promotional deals, and loyalty programs to attract and retain customers. These incentives will not only enhance customer satisfaction but also foster brand loyalty.

By achieving these objectives, the online grocery store website project aims to revolutionize the way people shop for groceries, making it a more efficient, secure, and enjoyable experience.

4. Software's and Languages Used in Project

ASP.NET:

ASP: ASP stands for Active Service Page. It was Develop by Microsoft technology. Its programs run inside IIS (Internet Integrated Services). It is the group of internet server with additional capability. ASP has only one platform which means that it has only one page where we Design and code, logic cannot be hidden here.

.NET: .NET is a framework or software development platform. It can be used to develop high scale application. Its Software component that runs on the window operating system and provides tools and libraries that enabled developers to create, debug and deploy application much faster and easier. It supports programming language such as C#, J#, C++, C etc.

Advantages of ASP.NET:

1. ASP.NET drastically reduces the amount of code required to build large applications.
2. With built-in Windows authentication and per-application configuration, your applications are safe and secured.
3. It provides better performance by taking advantage of early binding, just-in-time compilation, native optimization, and caching services right out of the box.
4. The ASP.NET framework is complemented by a rich toolbox and designer in the Visual Studio integrated development environment. WYSIWYG editing, drag-and-drop server controls, and automatic deployment are just a few of the features this powerful tool provides.
5. Provides simplicity as ASP.NET makes it easy to perform common tasks, from simple form submission and client authentication to deployment and site configuration.
6. The source code and HTML are together therefore ASP.NET pages are easy to maintain and write. Also the source code is executed on the server. This provides a lot of power and flexibility to the web pages.

Project Report on Online Grocery Store

7. All the processes are closely monitored and managed by the ASP.NET runtime, so that if process is dead, a new process can be created in its place, which helps keep your application constantly available to handle requests.
8. It is purely server-side technology so, ASP.NET code executes on the server before it is sent to the browser.
9. Being language-independent, it allows you to choose the language that best applies to your application or partition your application across many languages.
10. ASP.NET makes for easy deployment. There is no need to register components because the configuration information is built-in.
11. The Web server continuously monitors the pages, components and applications running on it. If it notices any memory leaks, infinite loops, other illegal activities, it immediately destroys those activities and restarts itself.
12. Source code is executed on the server. This provides a lot of power and flexibility to the web pages.
13. ASP.NET provides full support for XML, CSS and other new as well as established web standards.

MVC :

MVC, which stands for Model-View-Controller, is a design pattern commonly used in software engineering to separate concerns and organize code in a modular and maintainable way.

- **Model:** Represents the application's data and business logic. It directly manages the data, logic, and rules of the application.
- **View:** Represents the user interface and displays data from the Model to the user. It also sends user commands to the Controller.
- **Controller:** Acts as an intermediary between Model and View. It takes user input from the View, processes it (possibly altering the Model), and updates the View accordingly.

This separation allows developers to manage complex applications more easily by dividing the application into three interconnected components, each with distinct

Project Report on Online Grocery Store

responsibilities. This leads to more organized code, easier maintenance, and improved scalability.

C#:

C# is a Programming language which targets .NET Framework. It has own syntax and compiler. Its compiler results the MSIL code for the given input. It is a case sensitive language. Every statement must be terminated using semicolon (;). Every program must have main method or a function where main is entry point. It is strong type language. Every program will be started by a class.

The language we have used to develop code is C#. C# is high level programming language which is Object Oriented in nature. The Code behind file is written in C#. It supports all the features of Object Oriented approach as follows:

1. Abstraction: Abstraction is a process that involves identifying the essential features without including the internal details i.e., represent the needed information in program without presenting the details.

2. Encapsulation: Encapsulation is a mechanism that binds together data and methods that manipulate that data into a single unit. It keeps the data safe from any external interface and misuse.

3. Objects and Classes:

Objects are the basic run-time entities. The both data and function that operate on data are bundled as a unit called as object. They may represent a person, a place, a bank account, a table of data or any item that a program can handle.

A **Class** is a grouping of objects having identical properties, common behavior and shared relationship. Once a class has been defined, we can create any number of objects belonging to that class. For example: Mango, apple and oranges are members of the class Fruit.

4. Dynamic Binding: In Dynamic binding, the linking of method call to the code of the method to be executed in response to the method call is made at run time. The code of the method to be linked with method call is unknown until it is executed.

5. Message Passing: Message passing is the process by which an object sends data to another object or requests the other object to invoke a method. Message Passing provides an easy way of modeling real world problems in the computer.

Project Report on Online Grocery Store

6. Inheritance: Inheritance is the process by which the object of one class acquires the properties of the object of another class. We can take an existing class and add additional features to it without modifying the original class.

7. Polymorphism: Polymorphism is a very powerful concept that allows the designing of amazingly flexible applications. The word Polymorphism is derived from two Greek words '**Poly**' which means '**Many**' and '**Morphos**' which means '**Forms**'. So, Polymorphism means the ability to take many forms.

8. Operator Overloading: We can redefine or overload most of the built-in operators available in C#. Thus a programmer can use operator with user-defined types as well. Overloaded operators are functions with special names the keyword operator followed by the symbol for the operator being defined.

9. Simple: It is simple because

- Pointers are missing in C#.
- Unsafe operations such as direct memory manipulation are not allowed.
- In C# there is no usage of "::" or "→" operators.
- "==" is used for comparison operation and "=" is used for assignment operation.

HTML:

HTML is Hypertext Markup Language used to design web pages. A page description language used on the World Wide Web that's defining the hypertext links between documents. It contain special markup tags <> to design the web page. I use the program called browser to view the documents. Using HTML one can add the formatted text, images, audio, video, hyperlinks in the web pages. The Basic tags of HTML are:

Format OF HTML

- **<HTML>**
- **<HEAD>**
- **<TITLE>**
- **<BODY>**
- **<A href>:**
Anchor tag used to link one page to other web page.
- **:**
This tag is used to embed any image to the web page.
- **<div>:**
This tag is used to divide web page into divisions and to position contents anywhere on the web page.
- **<table>:**
This tag is used to display tabular information in the web page.
The table tag displays information in rows and columns.
The following code:

```
<table>
  <tr>
    <td>Row1-Col1</td>
    <td>Row2-Col2</td>
  </tr>
  <tr>
    <td>Row2-Col1</td>
    <td>Row 2 - Col 2</td>
  </tr>
</table>
```

The element, like most elements, is a container. It is not an image in and of itself, but a receptacle for one.

Let's first take a look at what I used to display the image below. Note that there is no closing tag. It's one of the few elements that doesn't use them.

Project Report on Online Grocery Store

`<imgsrc="images/atitlan.jpg" class="flr" alt="Lake Atitlan, Guatemala" width="300" height="240">`

- **<form> tag:** The <form> tag is used to create a HTML form for user input. **The <input> element** is the principal element that collects information entered into a form.
It's been around since the beginning of the web, but in HTML5 <input> has been revamped into a new and greatly improved tool – or at least it will be.
- **The and tags:**
There are two types of lists. These are bulleted and numbered lists. Needless to say, those on high who name such things couldn't simply call them "Bulleted" or "Numbered", but "**Unordered**" and "**Ordered**". Whatever – I guess it could be worse.

UL – Unordered lists:

Example:

- Candid Shot
- Cinematography
- Photo Album

UL code :

```
<ul>  
    <li>List item 1</li>  
    <li>List item 2</li>  
</ul>
```

OL – Ordered Lists:

Example:

Project Report on Online Grocery Store

- Wedding
- Pre-Wedding

OL Code:

```
<ol>  
    <li>List item 1</li>  
    <li>List item 2</li>  
</ol>
```

Advantages of HTML:

1. First advantage it is widely used.
2. Every browser supports HTML language.
3. Easy to learn and use.
4. It is by default in every window so you don't need to purchase extra software.

CSS :

- **CSS** stands for **Cascading Style Sheets**
- CSS defines **how HTML elements are to be displayed**
- Styles were added to HTML 4.0 **to solve a problem**
- CSS saves a lot of work
- External Style Sheets are stored in **CSS files**

Examples of CSS :

```
/* Styling the body element */
```

```
body {  
    background-color: #f0f0f0;  
    font-family: Arial, sans-serif;  
    margin: 0;  
    padding: 0;  
}
```

```
/* Styling headers */
```

```
h1 {
```

Project Report on Online Grocery Store

```
color: #333;  
text-align: center;  
}
```

```
/* Styling paragraphs */
```

```
p {  
    color: #666;  
    line-height: 1.5;  
    margin: 10px 0;  
}
```

5.Other Software Tools

Visual Studio 2019

We have used Microsoft Visual Studio, which is an open source tool of Asp.net available at internet. **Microsoft Visual Studio** is an integrated development (IDE) from Microsoft. It is used to develop computer programs for Microsoft Windows, as well as web sites, web applications and web services. Visual Studio uses Microsoft software development platforms such as Windows API, Windows forms, Windows presentation foundation, Windows store and Microsoft Silver light. It can produce both native code and managed code.

Visual Studio includes a code editor supporting Intelligence (the code completion component) as well as code refactoring. The integrated debugger works both as a source-level debugger and a machine-level debugger. Other built-in tools include a forms designer for building GUI applications, web designer, class designer, and database schema designer. It accepts plug-ins that enhance the functionality at almost every level—including adding support for source-control systems (like Subversion) and adding new toolsets like editors and visual designers for domain specific languages or toolsets for other aspects of the software development life cycle (like the Team Foundation Server client: Team Explorer).

Visual Studio supports different programming languages and allows the code editor and debugger to support (to varying degrees) nearly any programming language, provided a language-specific service exists. Built-in languages include C, C++ and C++/CLI (via Visual C++), VB.NET (via Visual Basic.NET), C# (via Visual C#), and F# (as of Visual Studio 2010^[7]). Support for other languages such as Python, Ruby, Node.js, and M among others is available via language services installed separately. It also supports XML/XSLT, HTML/XHTML, javascript and CSS. Java (and J#) were supported in the past.

Advantages of Visual Studio 2019

1. **Better code intelligence:** Visual Studio 2019 has better code intelligence support which makes it easier for look for methods and functions. You can now easily search for inline keyword, or even use abbreviation to search for properties or methods.

Project Report on Online Grocery Store

2. **Improved multi-targeting support:** Though multi-targeting was there in Visual Studio 2008, but the Visual Studio 2010 has got better support for it. With its new “reference assemblies”, it provides 100% accurate intelligence.
3. **Multi-monitor support:** Earlier, all editor and child windows are hosted inside a single parent window, but with the new IDE you can host every single child windows as separate windows outside of the main window. You can move these to other monitors which make it to support multiple monitors.
4. **Parallel computing:** With Visual Studio 2010, now you can take advantage of multi-core processor by using parallel computing feature. This helps you to write code which can execute even faster. Visual Studio also supports parallel debugging for the parallel programming.
5. **Reference Highlight:** Another advantage of Visual Studio 2010 IDE is the reference highlight. By this feature, it will highlight you all the call to that method or member variable, which you can find easy enough to search all the position of the reference wherever it has been called.
6. **Better Toolbox support:** Visual Studio now came up with better Toolbox support you can now search Toolbox Item very easily. Just type the desired name of the Toolbox Item and the IDE will jump into the focus of matched element. Pressing TAB will bring the focus to the next matching element.
7. **Breakpoints:** Visual Studio has now a better advantage in terms of Bookmarks. A team can now collaborate bookmarks between them by using the import/export bookmarks. You can now pin the debug value so that you can access it in later point of time, also you can now add a label to your bookmark.

MS SQL Server 2012

Microsoft SQL Server is a relational database management system developed by Microsoft. As a database server, it is a software product with the primary function of storing and retrieving data as requested by other software applications which may run either on the same computer or on another computer across a network (including the Internet).

Microsoft markets at least a dozen different editions of Microsoft SQL Server, aimed at different audiences and for workloads ranging from small single-machine applications to large Internet-facing applications with many concurrent users.

Features of Microsoft SQL Server 2012

1. Database mirroring

Database mirroring is a new high-availability feature in SQL Server 2012. It's similar to server clustering in that failover is achieved by the use of a stand-by server; the difference is that the failover is at the database level rather than the server level. The primary database continuously sends transaction logs to the backup database on a separate SQL Server instance. A third SQL Server instance is then used as a witness database to monitor the interaction between the primary and the mirror databases.

2. Database snapshots

A database snapshot is essentially an instant read-only copy of a database, and it is a great candidate for any type of reporting solution for your company. In addition to being a great reporting tool, you can revert control from your primary database to your snapshot database in the event of an error. The only data loss would be from the point of creation of the database snapshot to the event of failure.

3. CLR integration

With SQL Server 2012, you now have the ability to create custom .NET objects with the database engine. For example, stored procedures, triggers, and functions can now be created using familiar .NET languages such as VB and C#. Exposing this functionality gives you tools that you never had access to before such as regular expressions.

4. DDL triggers

Project Report on Online Grocery Store

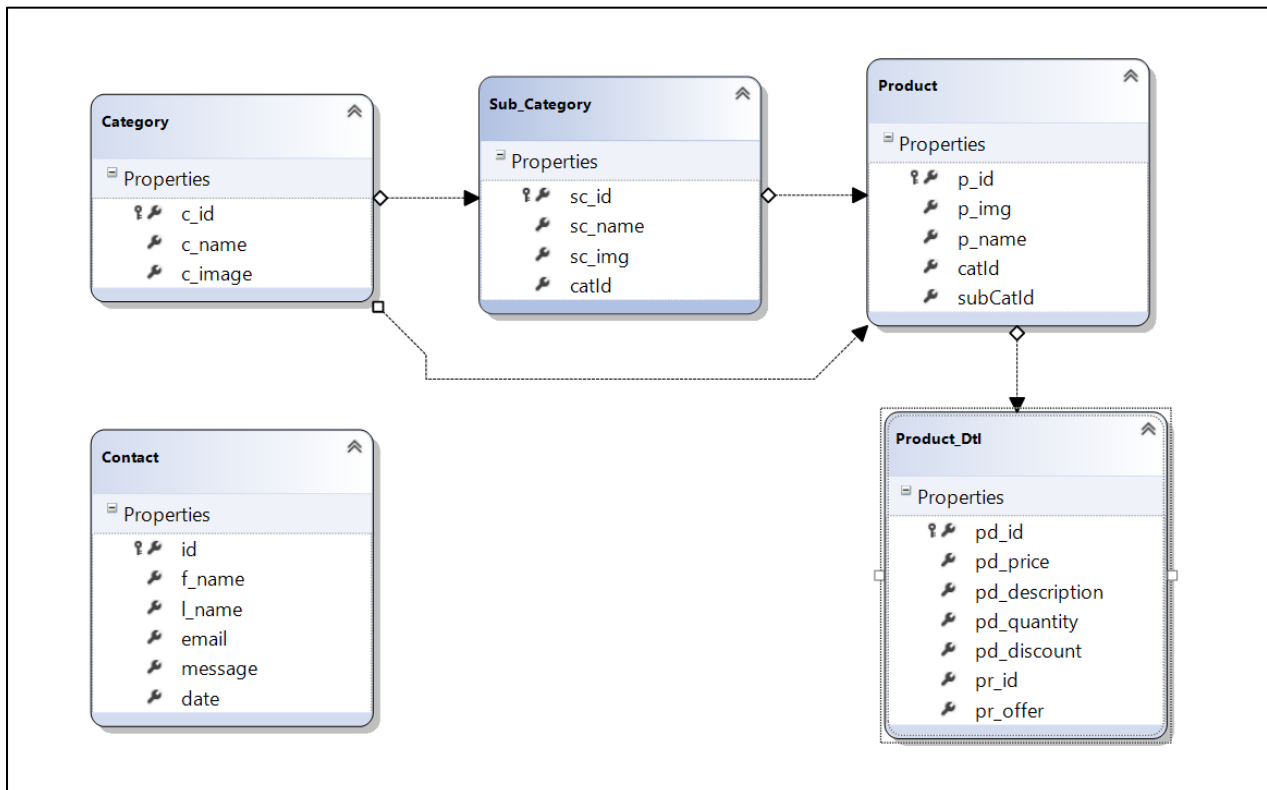

In previous articles, I outlined how you can use data definition language (DDL) triggers in SQL Server 2012 to implement custom database and server auditing solutions for Sarbanes-Oxley compliance (here are part one and part two of my SOX articles). DDL triggers are defined at the server or database level and fire when DDL statements occur. This gives you the ability to audit when new tables, stored procedures, or logins are created.

5. Ranking functions

SQL Server 2012 provides you with the ability to rank result sets returned from the database engine. This allows you to customize the manner in which result sets are returned, such as creating customized paging functions for Web site data.

6.Design

ER Diagram:

Database

In designing database, various dependencies have been kept in consideration. Rules of normalization were followed to make the databases non-redundant and consistent.

We have used the database naming DRdb is Final. In DRdb, Finally We had created table as:

Tables:

Data is often stored in Tables and these tables often reside in databases. In the .NET Framework, the Data Table types stores data in memory. Data Table is the central object in the ADO.NET library. If we are working with ADO.NET, accessing data

Project Report on Online Grocery Store

from Database, we cannot escape from Data Table. A Data Table can be created a use independently, or can be used by other .NET framework Objects such as Dataset and Data View. The Data Table class is the member of the system. Data Namespace within the .NET Framework class Library.

A well-designed database has a specific table for each type of data to be managed, and then displays the appropriate content from those tables in clusters relating to a single process that the user needs to manage. That clustering of associated records of information would never be possible without tables. But with tables, is a great way to boost productivity and profits. You can literally have access to everything you need at that moment. This is why databases are driving the evolution of the modern office.

Product Table:

DHARMPREETPC....dbo.Products ×

▶	id	int	☐
	f_name	nvarchar(50)	☒
	l_name	nvarchar(50)	☒
	email	nvarchar(80)	☒
	message	nvarchar(200)	☒
	date	date	☒
			☐

7.Constraints/Conditions

The constraints and the limitations within the system are the drawbacks that occur during the implementation of the system. These limitations and the constraints can crop up in almost every system; the most important fact is to find a way to overcome these problems. The analysis of an information system produces the details that clearly describe how a system will meet the requirements identified during system analysis. There are certain constraints and conditions applied in this system.

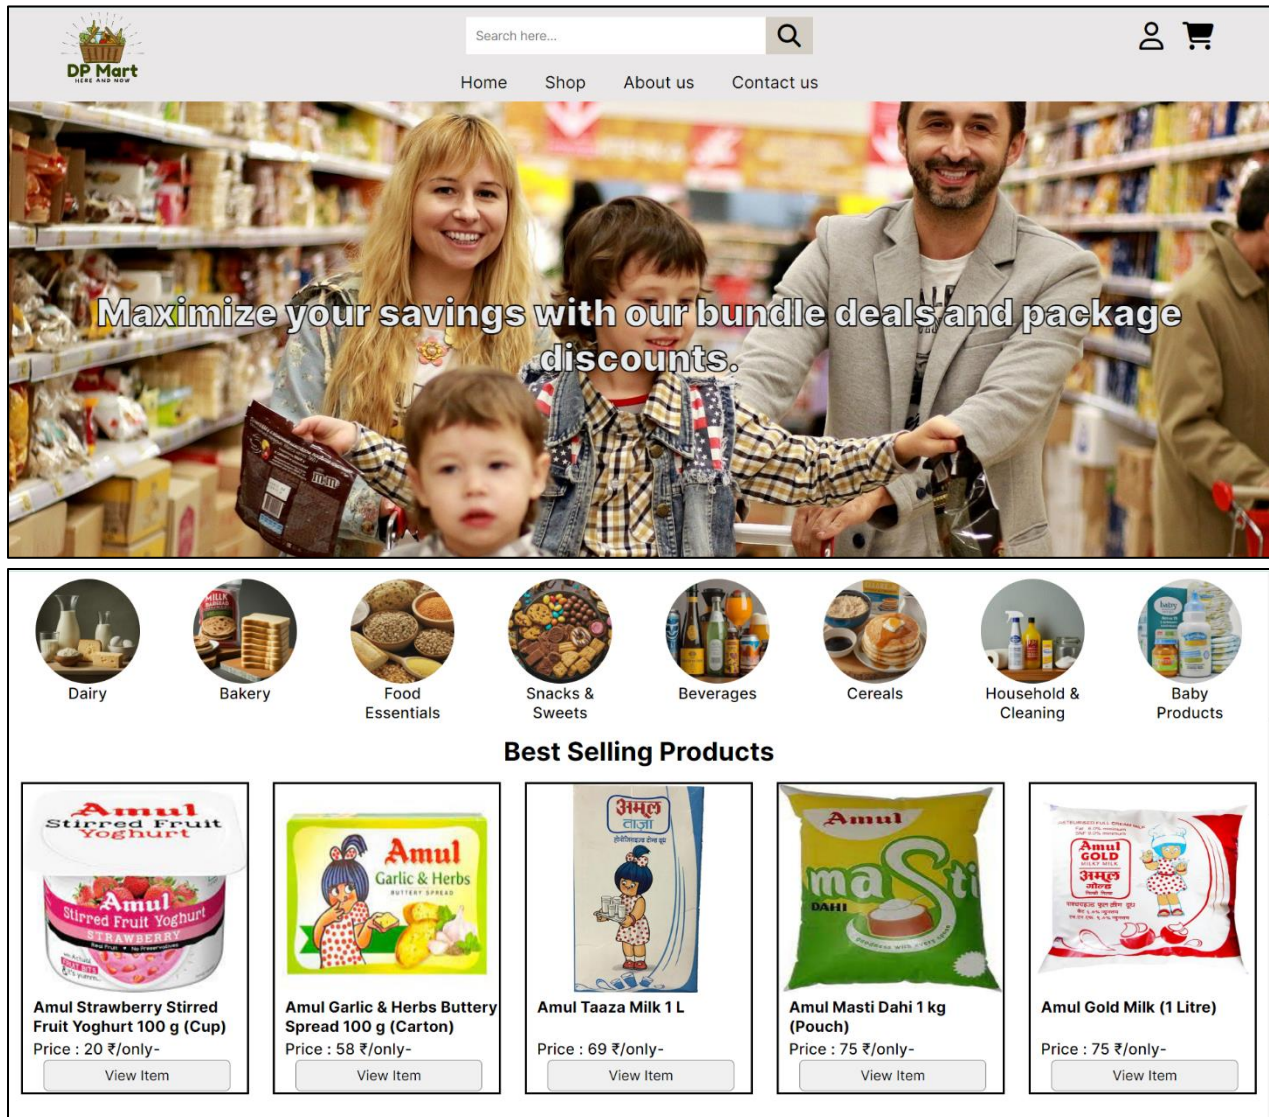

1. Names of persons are up to 20 characters long.
2. Password field can be 8 characters or longer and at least one capital alphabet or special symbol.
3. User Name will be used only once for verification.

Outputs

The output design is a process that involves designing necessary outputs that should be given to various client/contractors according to their requirements. Efficient, intelligible output design helps them in better decision making for the work.

About Us

Our Story

Welcome to FreshMart, your one-stop destination for all your grocery needs! At FreshMart, we believe in providing our customers with the highest quality products, sourced from the finest producers locally and globally. Our extensive selection ranges from fresh produce, organic options, and dairy products to pantry essentials, gourmet treats, and household supplies. We are committed to sustainability and offer a variety of eco-friendly and ethically sourced items.

FreshMart, where freshness meets convenience!

The screenshot shows the registration interface of the DP Mart website. At the top, there is a header with the DP Mart logo, a search bar, and navigation links: Home, Shop, About us, and Contact us. Below the header, the main content area is titled "Register_User" and features a yellow box with the heading "Create a new account." Inside this box, there are input fields for Email, Password, and Confirm password, and a "Register" button. The layout is identical to the login page, with the same header and footer.

9.Menu

Menus are navigation data controls that help in navigating from one page to another. We have created two menus in our website:

1. User menu
2. Admin menu

● User

User menu is created for facilitating first of all users have to create their account for place order and they can see their pictures privately.

User menus are:

1. **Home:** Here in this page information about our website is given.
2. **Shop:** In this menu there is display of all products and customer can check detail of any product by clicking on view item.
3. **About Us:** This section contain information about website.
4. **Contact Us:** With this menu user can send their feedback or any complain by filling the required fields like Name, Address, Email and Message.
5. **Sign In:** This menu allows the Admin to log in their account to control the system by and also user can create their accounts and log in to their accounts by filling their information like: User name and Password.

● Admin

Using these Menus the administrator will be able to manage the system and perform the administrative functions.

Admin Menus are:

1. **Home:** In this page information about the admin is given.
2. **Product:** This page contain list of Product that are available to present. It contain basic information about product.
3. **Product Detail:** It contain additional information to product like its price, description ,discount.

Project Report on Online Grocery Store

4. **Category:** In this page there is a list of categories of product. Product relates to this category.
5. **Subcategory :** This page have information about the Subcategory that link to the category
6. **Feedback :** In this menu admin manage the feedback given by the users.
7. **Log Out:** This menu is used to log out from the account back to the home.

10. Coding, Testing, Implementations

Coding:

After the design phase, a particular programming language is chosen. The goal of the coding phase is to translate the design of the system into code in a given programming language, that is to implement the design in the best possible well written code can reduce the next phase's efforts. Generally the structured programming is used because it liveries the control flow in program

Testing:

This phase is the major quality control measures employed during s/w development. Here the errors are removed from s/w. Testing not only uncovers the errors introduced during coding, but also errors introduced during previous phases. This makes the cost of the phase very high.

Implementation:

The implementation phase is less creative than system design. It is primarily concerned with user training, site preparation and file conversion. When the candidate system is linked to terminal or remote sites, the telecommunication network along with the system are also included in the implementation during the final testing, user acceptance is tested, followed by user training. Depending on the nature of the system, extensive user training may be required. Conversion usually takes place at about the same time the user is being trained or later.

System testing checks the readiness and accuracy of the system to access, update and retrieve data from new files. Once the programs become available, test data and read into the computer and processed against the file(s) provided for testing. If successful, the program(s) is then run with "live" data. Otherwise, diagnostic is used to locate an error in the program.

Maintenance:

Maintenance is the enigma of system development. It holds the software industry captive, trying up programming resources. System maintenance involves identified the need for change in the current system and making appropriate changes. Even the best-designed system may someday need to be replaced. When a problem or new opportunity is discovered, the system analysis phase of system life cycle begins again.

A major problem with software maintenance is its labor-intensive nature. Consider a change in the code. Altering the code, no matter how slight, must be manually introduce in to each program because there is no easy way of making sure that the changes will interface with all the programs.

Maintenance demands more orientation and training than any other programming activities especially for entry-level programmers. The environment must recognize the need of maintenance programmers for tools, methods and training.

11. **Bibliography**

To complete this project Photography we used ASP.net at front end and SQL Server 2012 as back end (database).

Before designing this Website I wasn't too much familiar with what is Visual Studio, how to design the different Websites and number of things related to the Web designing. But after having discussion with my guide I came to know that what is actually Visual Studio and how Websites will design. Then I decided to make Website on the Photo Studio. Then I have analyzed the whole problem on a larger scale of my project.

At the end I would like to appreciate the effort made by my guide and for this valuable guidance without which it wouldn't be easy for me to make such being project alone.

We took some knowledge by following these Books & Websites that were of immense help:

BOOKS:

1. Programming Microsoft ASP.NET MVC
2. Introducing .NET 4.5
3. Programming in C# by Balagurusamy
4. Professional Microsoft SQL Server 2012
